

U.S. Economic Comment

- Inflation: encouraging signs in July
- Housing services: a disinflationary tailwind
- Inflation expectations: well grounded

The July CPI

Key inflation data released this week suggest that restrictive monetary policy is making headway in the fight against rapid underlying inflation. We approached the June CPI report with guarded optimism when the core printed at 0.158 percent (month-over-month), but cautioned that a single favorable reading was unlikely to deter Fed officials from hiking the federal funds rate to a range of 5.50 to 5.75 percent by the end of 2023. Indeed, the FOMC raised rates by 25 basis points at the July meeting (range of 5.25 to 5.50 percent) and indicated that an additional shift in policy would be contingent on the evolution of the incoming data. The latest CPI report -- one of two between now and the September FOMC meeting -- showed a similar result on core inflation to that in June (chart, below left).

We view the July CPI reading as currently tilting the Committee toward a pause at the September meeting, but anticipate that the body of data between now and the end of the year will still suggest the need for additional policy restriction, with the final hike of 25 basis points possibly occurring at the October/November meeting. Essential to our view that additional policy firming is possibly required and that maintenance of a restrictive stance is likely for some time are readings of underlying inflation. One of our preferred measures of underlying inflation, the median CPI from the Federal Reserve Bank of Cleveland, has shown sharp month-to-month deceleration recently, including an increase of 0.2 percent in July, but year-over-year inflation of 6.1 percent still indicates persistent price pressure (chart, below right).

Core CPI

Median CPI

A Disinflationary Impulse from Housing Services

The downward trajectory of inflation in coming months relies heavily on continued moderation in the costs of shelter, which made a significant contribution to inflation in July. Shelter, which incorporates the Rent of Primary Residence and Owners' Equivalent Rent of Residences components from the CPI, accounts for approximately 35 percent of the total index. To date, core goods inflation has responded forcefully to restrictive Fed policy, but core service inflation has remained elevated in part because of sticky shelter costs (chart, next page). Fed officials and market participants are appearing to coalesce around the view that shelter costs will moderate further in coming months as the stock of existing rents turns over, but views on the speed and extent of the deceleration vary widely.

This report is issued by Daiwa Securities Group Inc. through its relevant group companies. Daiwa Securities Group Inc. is the global brand name of Daiwa Securities Co. Ltd., Tokyo ("Daiwa Securities") and its subsidiaries worldwide that are authorized to do business within their respective jurisdictions. These include: Daiwa Capital Markets Hong Kong Ltd. (Hong Kong), regulated by the Hong Kong Securities and Futures Commission, Daiwa Capital Markets Europe Limited (London), regulated by the Financial Conduct Authority and a member of the London Stock Exchange, and Daiwa Capital Markets America Inc. (New York), a U.S. brokerdealer registered with the U.S. Securities and Exchange Commission, a futures commission merchant regulated by the U.S. Commodity Futures Trading Commission, and a primary dealer in U.S. government securities. The data contained in this report were taken from statistical services, reports in our possession, and from other sources believed to be reliable. The opinions and estimates expressed are our own, and we make no representation or guarantee either as to accuracy, completeness or as to the existence of other facts or interpretations that might be significant.

The Federal Reserve Bank of San Francisco weighed in on the discussion this week with a paper by staff economists that modeled the trajectory of shelter inflation based on various home price and rental cost indexes (Augustus, Kmetz, Schuyler Louie, and John Mondragon (2023). Where is Shelter Inflation Headed?" FRBSF Economic Letter. Federal Reserve Bank of San Francisco, August 7, 2023, <https://www.frbsf.org/economic-research/publications/economic-letter/2023/august/where-is-shelter-inflation-headed/>). Specifically, the team's statistical model forecast shelter inflation over an 18-month time horizon based on inputs from 18 core-based statistical areas (CBSAs; i.e., "cities and surrounding communities that can provide a useful economic unit for thinking about housing markets") and a wide range of other housing market indicators. In theory, the broad approach enhances the precision of the model, as no one measure is representative of the U.S. housing market and does not track precisely with the CPI shelter index (chart, below left).

CPI

* Services excluding energy services and housing services. The index is calculated by Haver Analytics.

Sources: Bureau of Labor Statistics via Haver Analytics; Daiwa Capital Markets America

The encouraging takeaway from this analysis is that aggressive increase in the federal funds rate since March of last year had a "significant effect on slowing housing markets" and that the trend is likely to continue (even potentially leading to deflation in shelter costs). However, we caution that the wide error band around the baseline forecast indicates that the cooling is not a pre-determined outcome (chart, below right). Therefore while the note strikes a hopeful tone and offers evidence that restrictive policy is working it also underscores that it is not yet time to pivot away from the current policy setting.

Inflation Expectations: Consistent with 2 Percent in the Longer-Term

We have been monitoring developments with inflation expectations because views of consumers and businesses over time impact actual inflation, in part through wage demands and forward-looking price setting. Expectations have ebbed and flowed over the course of the current expansion, but they remained mostly contained despite a bout of brisk inflation that is only now starting to slow. The anchoring of inflation expectations, which Fed officials view as a necessary condition to retuning actual inflation to two percent over

time, is influenced importantly by clear communication by Fed officials and the proper calibration of monetary policy to evolving conditions in the economy.

Additional evidence of the Fed's success in guiding the inflation expectations of consumers and market participants emerged on Friday with the release of the preliminary report on Consumer Sentiment from the University of Michigan and the Survey of Professional Forecasters compiled by the Federal Reserve Bank of Philadelphia. We tend to assign more weight to the Philly SPF because survey respondents are likely more adept at interpreting inflation data and economic developments more broadly, although we view both reports as signaling favorable developments.

With regard to the University of Michigan data, both the year-ahead and long-term measures of inflation expectations declined 0.1 percentage point in early August to 3.3 percent and 2.9 percent respectively. The year ahead measure, tracking closely movements in gasoline pump prices has fallen from a cycle high of 5.4 percent in March/April 2022; the longer-term measure has shown less variation, moving in a tight range of 2.7 to 3.1 percent in the past 12 months – up from 2.2 percent to 2.6 percent in the months immediately preceding the pandemic but still consistent with what fed officials view as well-grounded inflation expectations (chart, right).

The results on longer-term inflation expectations from the 23-Q3 iteration of the Survey of Professional Forecasters offer a similar view to those in the Michigan survey. The median five-year-ahead expectation for the change in the CPI rose 18 basis points to 2.68 percent, but we do not view the shift as terribly concerning in light of the drop around the turn of last year (chart, below left). More importantly, the 10-year median forecast rose only four basis points to 2.4 percent, comparable to pre-pandemic readings. More importantly, expected inflation in the back five years of the 10-year horizon actually eased to 2.12 percent from 2.22 percent, essentially matching the FOMC's target (chart, below right). Forecasts imply that market participants have a high degree of confidence that the Fed will meet its price stability mandate.

The Week Ahead

Retail Sales (July) (Tuesday)

Forecast: 0.4% Total, 0.4% Ex. Autos

Data on new vehicle sales suggest an increase in the auto component of retail sales in July. Sales excluding autos could remain on solid footing, supported by still-brisk credit expansion and firm wage growth generated by tight-labor market conditions.

Housing Starts (July) (Wednesday)

Forecast: 1.450 Million (+1.1%)

Recent improvement in builder sentiment in response to stirring in new home sales suggests that firms could again boost single-family housing starts in July after a decline of 7.0 percent in June. Multi-family starts fell in three of the past four months, including a drop of 9.9 percent in June, as preferences appear to be shifting back toward homeownership rather than renting. However, multi-family starts are often volatile from month-to-month, and we suspect recent declines overstated to a degree weakness in the multi-family area.

Industrial Production (July) (Wednesday)

Forecast: 0.0% Total, -0.1% Manufacturing

The anticipated flat reading in industrial production in July likely will reflect a jump in utility output that is offset by easing in the cyclically sensitive manufacturing and mining components. Utility output should be boosted by summer weather conditions (i.e. an increase in home cooling) after sharp declines in five of the past six months. In contrast, cuts to factory employment and worktimes suggest softening in manufacturing output and cuts to the mining workweek and rotary rig count imply weak mining activity.

Leading Indicators (July) (Thursday)

Forecast: -0.3%

Negative contributions from the ISM new orders index, the slope of the yield curve, and the factory workweek are likely to offset positive contributions from stock prices and unemployment claims and tip the monthly change in the index of leading economic indicators into negative territory for the 16th consecutive month. If the projected decline is realized, the index will have fallen 10.2 percent from the cyclical peak in December 2021.

Industrial Production: Manufacturing*

* The gold bar is a forecast for July 2023.
